STUDENT ID: UGW0202320122

COUSE CODE: SBIT322

LEVEL: 300

ASSIGNMENT. 2

Lab Exercise Report: Planning Poker Session

1. Introduction

Planning Poker is an Agile estimation technique used by development teams to assign effort values to user stories. It promotes collaboration, discussion, and consensus-based estimation.

2. Setup

The group conducted the session using:

- Online tool: *PlanningPoker.live* (or physical cards as an alternative)
- Fibonacci sequence for estimation: **1, 2, 3, 5, 8, 13**

Each team member participated in voting and discussion to reach a consensus on story points.

3. Selected Baseline Story

Baseline Story (2 Points)

User Story:

As a student, I want to search for a book by title so that I can quickly find books in the library.

Reason for Selection:

- Simple functionality
 - Well understood by all team members
 - Minimal complexity (basic search feature)
 - Used as a reference for estimating other stories
-

4. Estimated User Stories

Story 1: Borrow a Book

User Story:

As a student, I want to borrow a book so that I can read it at home.

Estimated Points: 3

Justification:

- Slightly more complex than search
 - Requires validation (availability, student eligibility)
-

Story 2: Return a Book

User Story:

As a student, I want to return a borrowed book so that it becomes available for others.

Estimated Points: 2

Justification:

- Similar complexity to baseline
 - Simple process with minimal logic
-

Story 3: Add New Book (Librarian)

User Story:

As a librarian, I want to add new books to the system so that they are available for students.

Estimated Points: 5

Justification:

- Requires data entry forms
 - Validation and database updates
 - More complex than borrowing
-

Story 4: Reserve a Book

User Story:

As a student, I want to reserve a book so that I can borrow it when it becomes available.

Estimated Points: 5

Justification:

- Requires queue management
 - Notifications and availability tracking
-

Story 5: Generate Reports

User Story:

As a librarian, I want to generate reports so that I can track library usage.

Estimated Points: 8

Justification:

- Involves data aggregation
 - Multiple report types
 - Higher complexity
-

5. Newly Discovered Acceptance Criteria

During the estimation discussions, the team identified additional acceptance criteria:

For Borrow Book

- The system must check if the student has overdue books
 - The system must limit the number of books a student can borrow
-

For Reserve Book

- Users should be notified when the book becomes available
 - Reservations expire after a certain period
-

For Add New Book

- ISBN must be unique
 - All required fields (title, author, category) must be filled
-

For Generate Reports

- Reports should be downloadable (PDF/Excel)
 - Reports should be filterable by date range
-

6. Observations from the Session

- Some stories initially had different estimates due to varying understanding
 - Discussion helped clarify requirements and assumptions
 - The baseline story improved consistency in estimation
 - Complex stories required more discussion and breakdown
-
